Epic Solitude Katherine Keith 2020-02-04 All her life, Katherine Keith has hungered for remote, wild places that fill her soul with freedom and peace. Her travels take her across America, but it is in the vast and rugged landscape of Alaska that she finds her true home. Alaska is known as a place where people disappear—at least a couple thousand go missing each year. But the same vast and rugged landscape that contributed to so many people being lost is precisely what has gotten her found. She and her husband build a log cabin miles away from the nearest road and create a life of love. An idyllic existence, but with isolation and brutal living conditions can also come heartbreak. Chopping wood and hauling water are not just parts of a Zen proverb but a requirement for survival. Keith experiences tragic loss and must push on, with her infant daughter, alone in the Alaskan backcountry. Long-distance dog sledding opens a door to a new existence. Racing across the state of Alaska offers the best of all worlds by combining raw wilderness with solitude and athleticism. The Iditarod Trail Sled Dog Race, the “Last Great Race on Earth,” remains a true test of character and offers the opportunity to intimately explore the frontier that she has come to love. With every thousand miles of winter trail traversed in total solitude, she confronts challenges that awaken internal demons, summoning all the inner grief and rage that lies dormant. In the tradition of Cheryl Strayed’s *Wild* and John Krakauer’s *Into the Wild*, *Epic Solitude* is the powerful and touching story of how one woman found her way—both despite and because of—the difficulties of living and racing in the remote wilderness.

Journey from the Center of the Sun Jack B. Zirker 2002 Jack Zirker takes us on an imaginary voyage from the center of the sun to its surface, showing us how sunlight is made and finally following the sun's energy to the far reaches of the solar system. Along the way, he introduces the basic processes at work in our nearest star and the exciting answers solar scientists are finding to problems that have long perplexed astronomers.

Journey from the Center of the Sun describes how theory and practice are coming together to provide a new understanding of this old star. At this moment, solar physicists are collecting the best observations ever obtained about the sun's interior and dynamic atmosphere, while a new breed of theorists is interpreting these data using computer simulations.

Zirker reports on cutting-edge advances and looks at the tough questions solar physicists are beginning to crack. How can we account for the solar wind that causes the sun to lose mass at an astonishing rate? Where have all the neutrinos gone? How does the sun generate magnetic sunspots, and why does it have a sunspot cycle? What causes a solar flare to explode? How does the sun affect the earth's climate? What is a sunquake? For the armchair astronomer or the student of astrophysics, this book provides an unusually complete picture of solar physics today.

The Sun from Space Kenneth R. Lang 2013-04-18 A comprehensive account of solar astrophysics and how our perception and knowledge of this star have gradually changed as mankind has elucidated ever more of its mysteries. The emphasis here is on the last decade, which has seen three successful solar spacecraft missions: SOHO, Ulysses and Yohkoh. Together, these have confirmed many aspects of the solar standard model and provided new clues to the numerous open questions that remain. The author, a leading researcher in the field, writes in a clear and concise style. Known also for his famous books "Astrophysical Formulae", "Sun, Earth and Sky" and the prize-winning "Wanderers in Space", he has succeeded once again in addressing a complex scientific topic in a very approachable way.

One Small Step? Gerhard Wisnewski 2012-12-17 Is it possible that the famous American moon landings were nothing but an illusion - a fabrication? Could NASA have fooled the world by broadcasting simulations that had been filmed for training purposes? From the very first manned flight into orbit right up to the present day there have been serious anomalies in the official narrative of the conquest of space. Bestselling author Gerhard Wisnewski dissects the history in minute detail - from the first Russian missions to the final American moon project of Apollo 17 - looking at films, photos, radio communications, personal statements and any other available material. Using forensic methods of investigation, he pieces together a complex jigsaw depicting a disturbing picture of falsifications, lies and fakery in the Cold War struggle for supremacy between the Soviet Union and the USA. The evidence he presents casts serious doubt on the possibility of humans ever having walked on the moon. Wisnewski's research calls for a reassessment of the received wisdom that has entered the fabric of our culture. The true story of space exploration has a more sinister undertone, he argues. Beneath the guise of civilian space travel the US military has been developing fearsome new equipment and weapons to be secretly stationed in space with the aim of militarizing the orbit around the earth. The potential targets: every human being on the planet. Profusely illustrated with over 200 photos and diagrams.

Cycles 1994

The 23rd Cycle Sten Odenwald 2002-08-14 On March 13, 1989, the entire Quebec power grid collapsed, automatic garage doors in California suburbs began to open and close without apparent reason, and microchip production came to a halt in the Northeast; in space, communications satellites had to be manually repositioned after flipping upside down, and pressure readings on hydrogen tank supplies on board the Space Shuttle Discovery peaked, causing NASA to consider aborting the mission. What was the cause of all these seemingly disparate events? Sten Odenwald gives convincing evidence of the mischievous—and potentially catastrophic—power of solar storms and the far-reaching effects of the coming "big one" brewing in the sun and estimated to culminate in the twenty-third cycle in the year 2001 and beyond. When the sun undergoes its cyclic "solar maximum," a time when fierce solar flares and storms erupt, fantastic auroras will be seen around the world. But the breathtaking spectacles will herald a potentially disastrous chain of events that merit greater preparation than Y2K. Is anyone listening? The 23rd Cycle traces the previously untold history of solar storms and the ways in which they were perceived by astronomers—and even occasionally covered up by satellite companies. Punctuated with an insert containing dramatic color images showing the erupting sun, the book also includes a history of the record of auroral sightings, accounts of communications blackouts from the twentieth century, a list of industries sensitive to solar storms, and information about radiation and health issues.
